

FEBRUARY  
2014

The Center for Conservation Biology conducts both basic and applied research focused on answering questions that are central to goal-oriented conservation. We strive to select projects that not only fill information needs but also serve as catalysts to increase public awareness and stimulate related work within the region. Projects generally fall within five broad program areas including 1) threatened and endangered species, 2) ecological applications, 3) bird migration, 4) anthropogenic stress, and 5) conservation design.
